

CAN A  
COMPUTER  
TALK LIKE A  
HUMAN?

This photo is a representation of the Turing Test, an iconic test used to determine whether a machine can mimic humans to the point of being indistinguishable. While individual humans can still--presumably--determine whether they are, in fact, human, Digital Human(ity) is about our ability to detect the human-ness of others. Online bots, AI, fake news, and other related phenomena challenge our ability to differentiate the "real" from the "manufactured."
